Texture

Visual texture synthesis

- Which one do you think is real?
- Right one is real.
- Goal of **texture synthesis** is to produce (arbitrarily many) new samples from an example texture.

Understanding Deep Image Representations by Inverting Them
-CVPR2015

Reconstruction from feature map

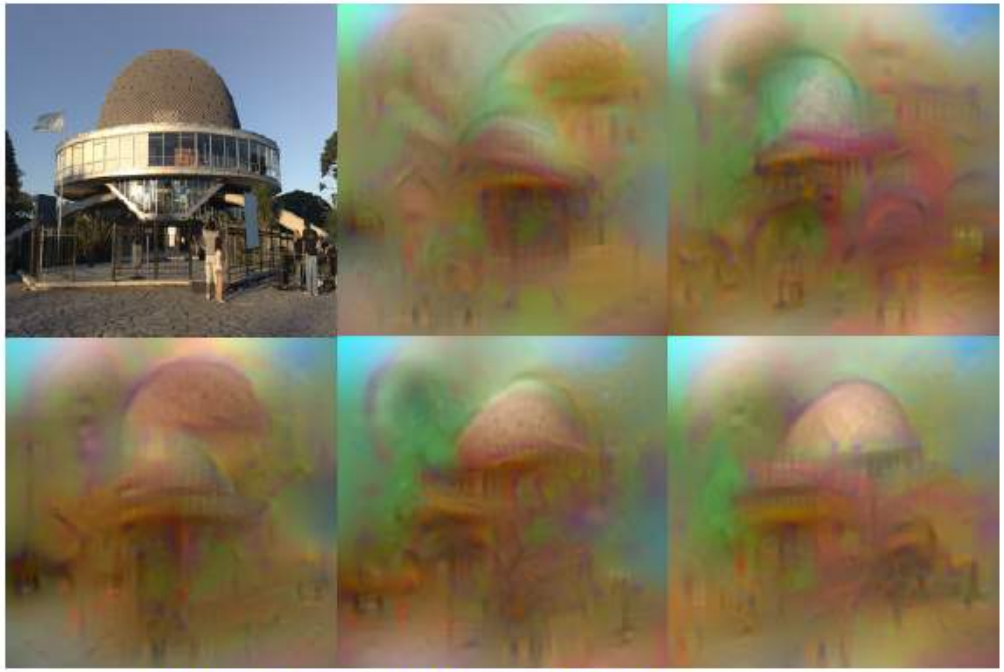

Figure 1. **What is encoded by a CNN?** The figure shows five possible reconstructions of the reference image obtained from the 1,000-dimensional code extracted at the penultimate layer of a reference CNN[15] (before the softmax is applied) trained on the ImageNet data. From the viewpoint of the model, all these images are practically equivalent. This image is best viewed in color/screen.

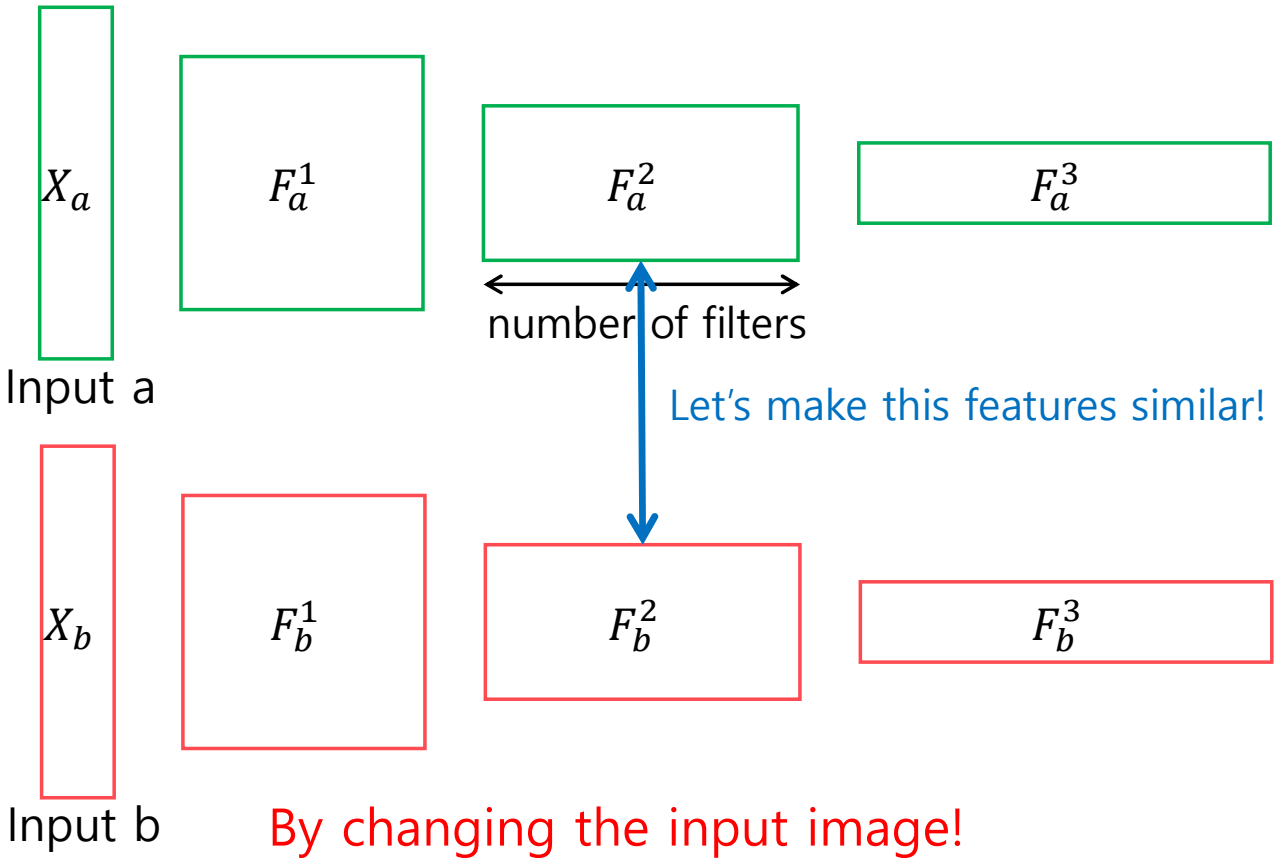
Reconstruction from feature map



Receptive Field

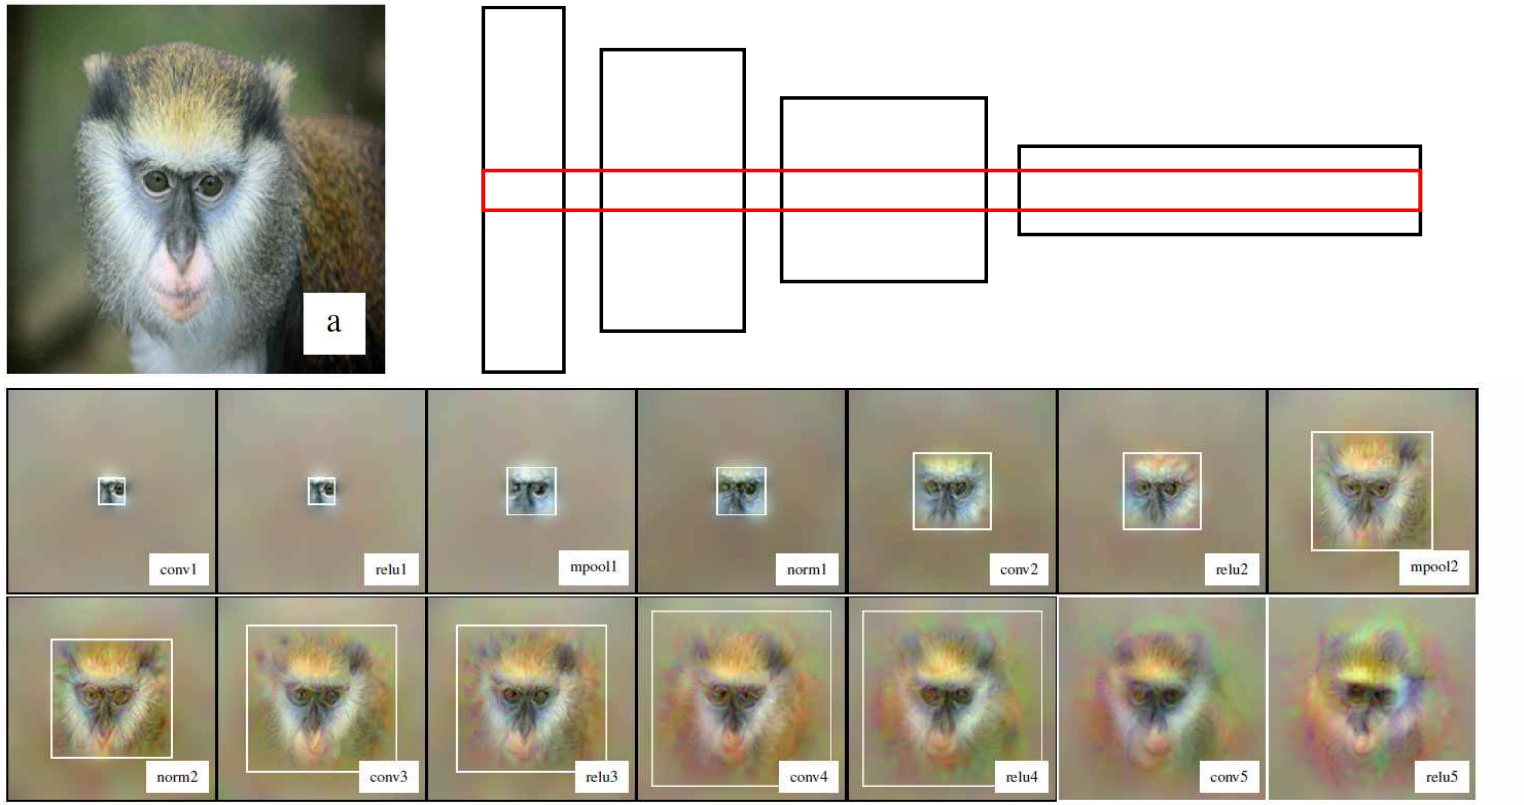


Figure 9. **CNN receptive field.** Reconstructions of the image of Fig. 5.a from the central 5×5 neuron fields at different depths of CNN-A. The white box marks the field of view of the 5×5 neuron field. The field of view is the entire image for conv5 and relu5.

Representation Learning

- Generator가 image를 외워서 보여주는 것이 아니어야 함
  - Memorization을 통한 1:1 mapping이 아니어야 함
- Generator의 input 공간인 latent space(z space)에서 움직일 때 급작스러운 변화(sharp transition)이 일어나지 않아야 함

Guidelines for Stable DCGAN

- Replace any pooling layers with strided convolutions
- Use batchnorm in both the generator and discriminator
- Remove fully connected hidden layers for deeper architectures
- Use ReLU activation in generator for all layers except for output, which uses Tanh
- Use LeakyReLU activation in the discriminator for all layers
